

hinglishParser.ts

frontend/utls | TypeScript

```

/**
 * hinglishParser.ts
 *
 * Classifies code-switched Hinglish speech into structured intent/stress signals.
 *
 * Standard NLP models are trained predominantly on formal English. Real users
 * under stress – especially in India – communicate in code-switched Hinglish:
 * mixing Hindi vocabulary, grammar, and idiom with English in the same sentence.
 *
 * "Yaar, deadline sar par hai" would produce near-zero signal in GPT-based
 * classifiers trained on English corpora. This parser handles it correctly.
 *
 * Architecture:
 * - Tier 1: Rule-based pattern matching (fast, no API, handles known phrases)
 * - Tier 2: Fallback to Groq for ambiguous or novel expressions
 * - Output: normalized score 0-100 for the semantic fusion channel (weight: 0.2)
 */
